

Configure Reaper with ReaScripts for Collaboration

Copy the 4 ReaScripts (Collab_Setup.lua, Collab_Open.lua, Collab_Save.lua, __startup.lua) to:
Mac: /Users/[username]/Library/Application Support/REAPER/Scripts
Windows: C:\Users\[username]\AppData\Roaming\REAPER\Scripts

Copy Empty.rpp to:

Mac: /Users/[username]/Library/Application Support/REAPER/ProjectTemplates
Windows: C:\Users\[username]\AppData\Roaming\REAPER\ProjectTemplates

Alternatively you can create your own “Empty” template.

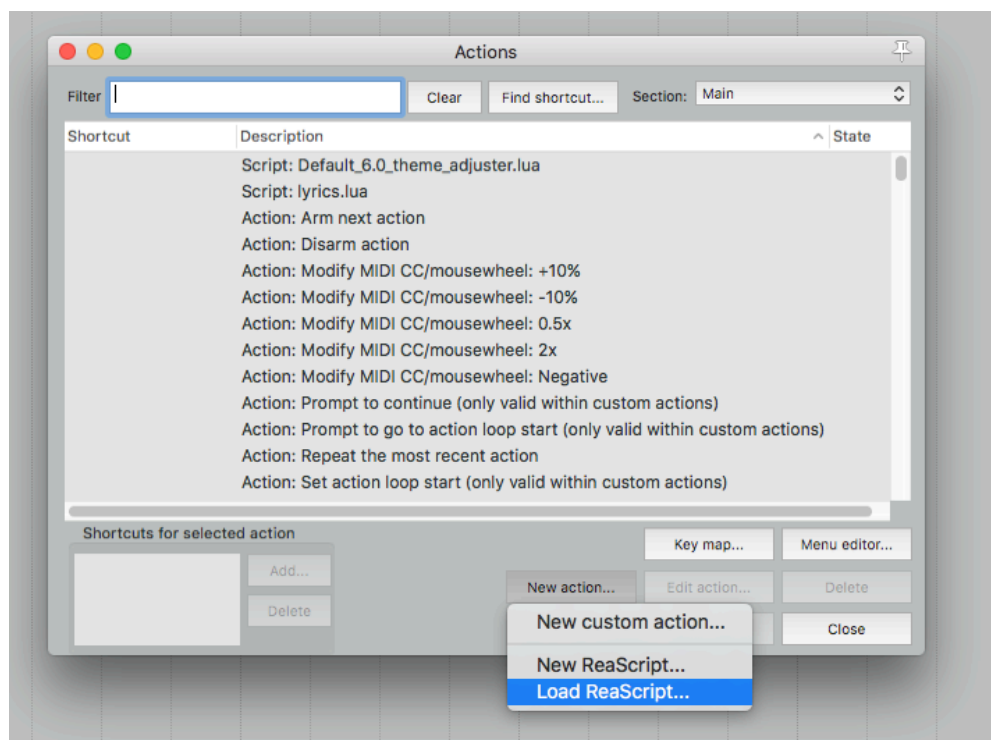

Set up a new project arranged in the way you want. EG: Add blank Audio tracks. Then save it.

File > Project Templates > Save project as template.. (Give it the name “Empty”)

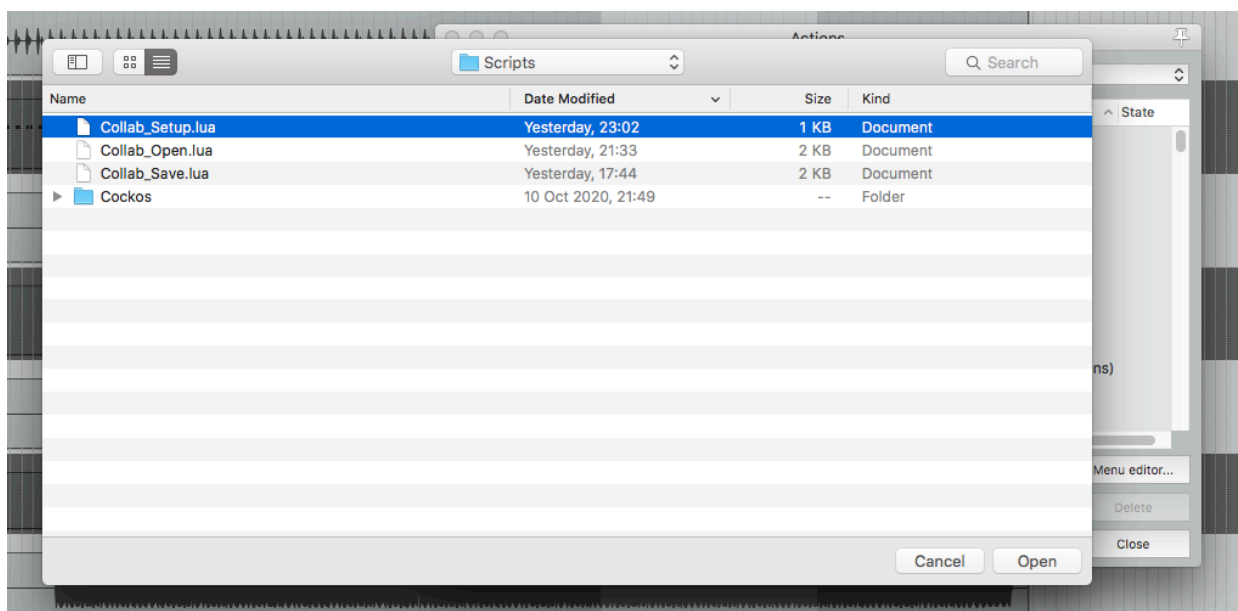

Adding Menu items for the Scripts

From the Menu Bar select: **Actions > Show action List**

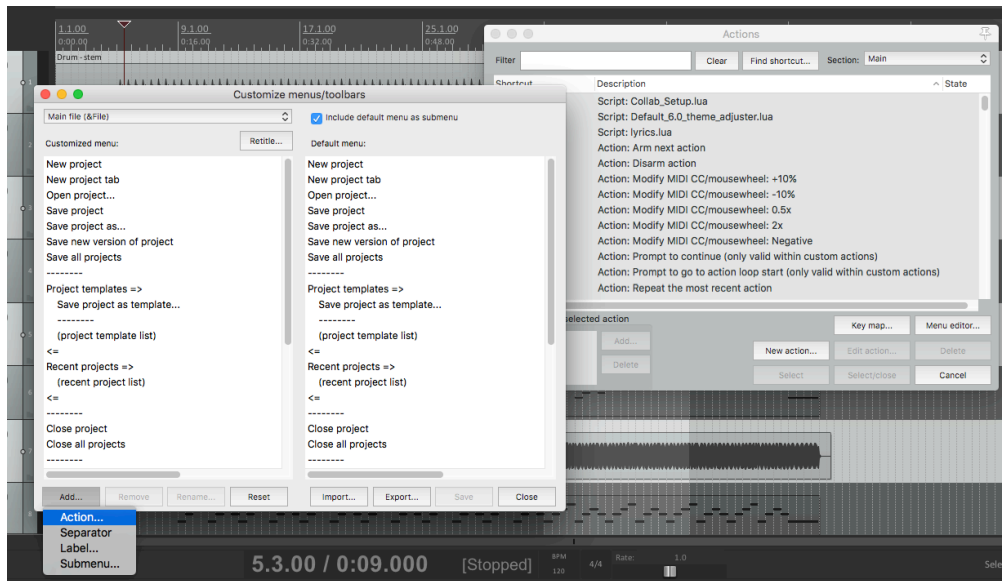

New action > Load ReaScript..

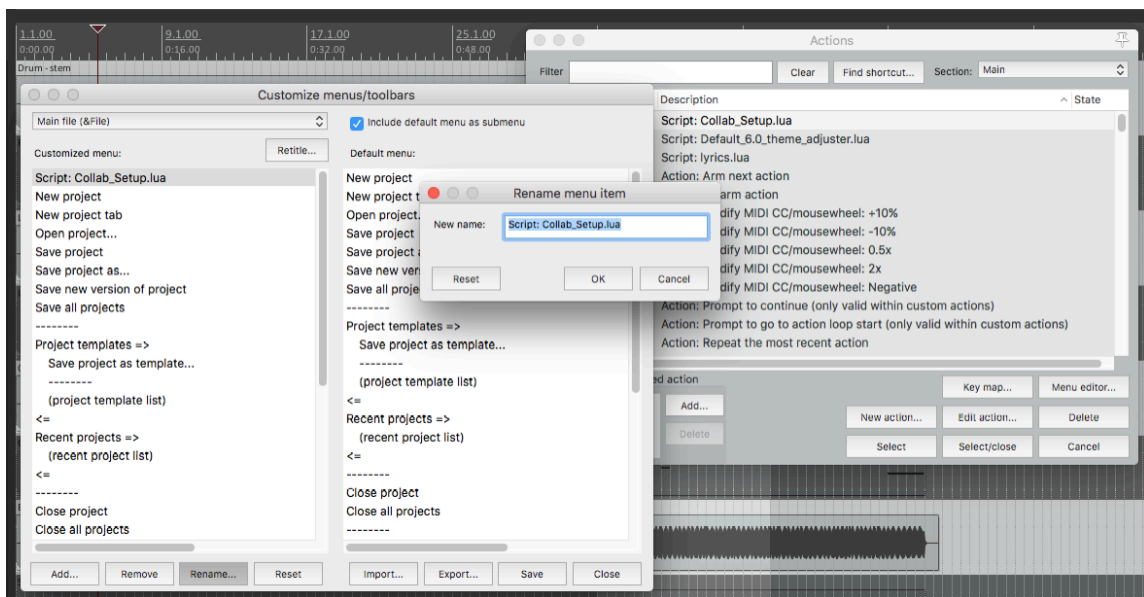

Open a script (EG: Collab_Setup.lua)

Select “Menu Editor..” in Actions panel then in “Customise menus/toolbars” **Add > Action..**

Click on “Script:Collab_Setup.lua” in “Actions” then click “Select”
The script is now added to the File Menu and you can “Rename” it.

Now go and add the other (Collab*.lua) scripts to your Menu. The __startup.lua script does not need a menu entry. Don't forget to click “Save” in the Customize menu panel. Here is how I configured my menu.
